

Standard Test Method for Vehicle Evaluation of Unleaded Automotive Spark-Ignition Engine Fuel for Intake Valve Deposit Formation¹

This standard is issued under the fixed designation D 5500; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

^{ε1} NOTE—Warning notes were editorially moved into the standard text in November 2003.

1. Scope

1.1 This test method covers a vehicle test procedure for evaluation of intake valve deposit formation of unleaded spark-ignition engine fuels. This test method uses a 1985 model BMW 318i² vehicle. Mileage is accumulated following a specified driving schedule on either public road or test track. This test method is adapted from the original BMW of North America/Southwest Research Institute Intake Valve Deposit test and maintains as much commonality as possible with the original test. Chassis dynamometers shall not be used for this test procedure as the BMW NA/SwRI IVD Test was not intended to be applicable to chassis dynamometers and no correlation between road operation and chassis dynamometers has been established.

NOTE 1—If there is any doubt as to the latest edition of Test Method D 5500, contact ASTM International.

1.2 The values stated in SI or inch-pound units shall be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system must be used independently of the other, without combining values in any way.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.* Specific statements on hazards are given throughout this test method.

2. Referenced Documents

2.1 ASTM Standards:³

D 235 Specification for Mineral Spirits (Petroleum Spirits) (Hydrocarbon Dry Cleaning Solvents)

2.2 ANSI Standard:

MC 96.1 American National Standard for Temperature Measurement Thermocouples⁴

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 *alternate mileage accumulation (AMA) driving cycle, n*—a driving schedule that is based on the U.S. Environmental Protection Agency Durability Driving Schedule, which contains various driving patterns for durability testing of emission control systems.⁵

3.1.2 *base fuel, n*—unleaded automotive spark-ignition engine fuel that does not contain a deposit control additive, but may contain antioxidants, corrosion inhibitors, metal deactivators, and oxygenates.

3.1.3 *deposit control additive, n*—material added to the base fuel to prevent or remove deposits in the entire engine intake system.

3.1.3.1 *Discussion*—For the purpose of this test method, the performance evaluation of a deposit control additive is limited to the tulip area of intake valves.

3.1.4 *driveability, n*—the quality of a vehicle's performance characteristics as perceived by the operator in response to changes in throttle position.

3.1.4.1 *Discussion*—The performance characteristics may include cold starting and warm-up, acceleration, vapor lock, and hot starting.

¹ This test method is under the jurisdiction of ASTM Committee D02 on Petroleum Products and Lubricants and is the direct responsibility of Subcommittee D02.A0 on Gasoline and Oxygenated Fuels.

Current edition approved Nov. 1, 2003. Published November 2003. Originally approved in 1994. Last previous edition approved in 1998 as D 5500–98.

² Originally obtained from BMW NA new car dealerships in the United States as a 1985 model year vehicle, the vehicle is currently available through the used vehicle market.
