

Designation: D5304 – 20

## Standard Test Method for Assessing Middle Distillate Fuel Storage Stability by Oxygen Overpressure<sup>1</sup>

This standard is issued under the fixed designation D5304; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

*This standard has been approved for use by agencies of the U.S. Department of Defense.*

### 1. Scope\*

1.1 This test method covers a procedure for assessing the potential storage stability of middle distillate fuels such as Grade No. 1D and Grade No. 2D diesel fuels, in accordance with Specification [D975](#).

1.2 This test method is applicable to either freshly refined fuels or fuels already in storage.

1.3 This test method is suitable for fuels containing stabilizer additives as well as fuels containing no such additives. However, fuels additized with dispersant additives, including dispersant-containing stability additives, may be ranked inaccurately using this test method compared to fuels that are not additized with dispersant additives.

1.4 [Appendix X1](#) provides information on other suggested test times and temperatures for which this test method may be used.

1.5 The values stated in SI units are to be regarded as standard. The values given in parentheses are for information only.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.* For specific warning statements, see [4.1](#), [6.2](#), [6.3](#), and [7.4](#).

1.7 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

### 3. Terminology

3.1 *Definitions*:

3.1.1 For definitions of terms used in this test method, see Terminology [D4175](#).

3.1.2 *membrane filter, n*—a porous article of closely controlled pore size through which a liquid is passed to separate matter in suspension.

3.2 *Definitions of Terms Specific to This Standard*:

3.2.1 *oxygen overpressure, n*—partial pressures of oxygen higher than that of air at atmospheric pressure.

3.2.2 *potential storage stability, n*—the tendency of a fuel to form insolubles under the conditions of this test method.

3.2.3 *reactor, n*—any vessel capable of sustaining pressures and temperatures above ambient, sometimes designated pressure vessel.

3.2.4 *weighing assembly, n*—a set of two filters and two aluminum weighing dishes used to determine total insolubles for each sample or blank.

<sup>1</sup> This test method is under the jurisdiction of ASTM Committee [D02](#) on Petroleum Products, Liquid Fuels, and Lubricants and is the direct responsibility of Subcommittee [D02.14](#) on Stability, Cleanliness and Compatibility of Liquid Fuels.

Current edition approved Sept. 1, 2020. Published September 2020. Originally approved in 1992. Last previous edition approved in 2015 as D5304 – 15. DOI: 10.1520/D5304-20.
