

Designation: D7305 – 08a (Reapproved 2020)

Standard Test Method for Reflection Density of Printed Matter¹

This standard is issued under the fixed designation D7305; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method describes a procedure for measuring reflection density of printed matter using a reflection densitometer or spectrodensitometer.

1.2 This test method is intended primarily for process colors (yellow, magenta and cyan) and black. With appropriate instrumentation, it may also be used for other colors.

1.3 This test method applies to prints made by any printing process on a flat surface, with reflection density values ranging from just above zero, on the unprinted substrate, through to around 2.5 for very dense prints.

1.4 This test method can be used for prints on paper, film or board but not for those on metal or foil. It can be conducted in the pressroom or laboratory.

1.5 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.7 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

2.4 Other Standard:³

DIN 16536-2:1986 Testing of prints and printing inks in graphic technology — Colour density measurements on on-press or off-press prints

3. Terminology

3.1 Definitions related to appearance are in Terminology E284.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 *reflection density, n*—the light-absorbing property of a material, expressed as the logarithm of the reciprocal of the reflectance factor (i.e. higher density indicates more light is absorbed). [$D = \log_{10} (1/R) = -\log_{10} (R)$]

3.2.2 *reflection densitometry, n*—the practice of characterizing the amount of light absorption of materials by measuring reflectance and calculating and reporting reflection density.

3.2.3 *spectrodensitometer, n*—a spectrophotometer with appropriate software to convert the measured reflectance values to reflection density.
