

Standard Practice for Acoustic Emission Monitoring of Structures During Controlled Stimulation¹

This standard is issued under the fixed designation E569/E569M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope*

1.1 This practice provides guidelines for acoustic emission (AE) monitoring of structures, such as pressure vessels, piping systems, or other structures that can be stressed by mechanical or thermal means.

1.2 The basic functions of an AE monitoring system are to detect, locate, and classify emission sources. Other methods of nondestructive testing (NDT) may be used to further evaluate the significance of reported acoustic emission sources.

1.3 *Units*—The values stated in either SI units or inch-pound units are to be regarded as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standards.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 *Definitions*—Definitions of terms relating to acoustic emission may be found in Section B of Terminology E1316.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 *AE activity*—the presence of acoustic emission during an examination.

3.2.2 *active source*—one which exhibits increasing cumulative AE activity with increasing or constant stimulus.

3.2.3 *critically active source*—one which exhibits an increasing rate of change of cumulative AE activity with increasing or constant stimulus.

3.2.4 *AE source intensity*—average energy, counts or amplitude per hit.

3.2.5 *intense source*—one in which the AE source intensity of an active source consistently exceeds, by a specified amount, the average AE source intensity of active sources.

3.2.6 *critically intense source*—one in which the AE source intensity consistently increases with increasing stimulus or with time under constant stimulus.

4. Summary of Practice

4.1 Acoustic emission examination of a structure usually requires application of a mechanical or thermal stimulus. Such stimulation produces changes in the stresses in the structure. During stimulation of a structure, AE from discontinuities (such as cracks and inclusions) and from other areas of stress concentration, or from other acoustic sources (such as leaks,
